

A product-minded software engineer dedicated to turning "it works" into "it's delightful." I thrive on crafting stable, high-quality architectures while ensuring every technical decision is rooted in user empathy and system reliability.

## Work Experience

### Software Engineer

#### Amazing Talker

2023–2026

- **Spearheaded the migration from Nuxt 2 to Nuxt 3 and the systematic refactoring of the core Appointment Pane.** Optimized rendering logic and decoupled global panels, reducing code reading time from 60 to 15 mins and saving 1-2 hours of development time per feature while ensuring zero-downtime transitions.
- **Orchestrated the 0-to-1 development of an In-house CRM System,** successfully replacing the third-party tool Intercom. Engineered custom modules for real-time messaging, status syncing, and automated feedback, effectively **eliminating long-term subscription costs** and enabling flexible internal customizations.
- **Optimized Core Web Vitals and device interaction flows,** reducing the number of URLs requiring INP improvement from 5,163 to 298 through memory leak diagnosis and redundant API cleanup. Redesigned device permission UX based on **Zoom benchmarks**, enabling real-time detection and one-click authorization.
- **Automated infrastructure and development workflows** using **Node.js** and **AWS Lambda**. Designed a SQL-based algorithm to detect experimental overlaps and streamlined CDN cache purging, significantly reducing data pollution and eliminating manual overhead during new server deployments.
- **Directed the "Announcement System" redesign as Project Owner,** managing the full lifecycle from requirement gathering to cross-functional alignment. Successfully **transferred operational control from RD to PD**, cutting long-term maintenance costs and accelerating the deployment cycle.
- **Leveraged AI-augmented engineering to accelerate complex refactoring and migration tasks.** Developed a **custom AI agent for pre-code reviews** to automate architectural compliance checks and static analysis, significantly reducing peer-review turnaround time and maintaining high code standards across the transition
- **Implemented a data-driven notification system for lesson requests** with an "expiration-priority" sorting logic. Successfully **reduced the lesson expiration rate by 13%** (from 6.8% to 5.9%) within 5 days of launch, directly impacting platform retention and revenue.

### Junior Frontend Developer

#### Good Game

2021–2022

- Developed frontend features based on SRS and PM requirements, collaborating with backend engineers to integrate with existing system architecture and deliver on schedule.
- Implemented responsive UI pages and animations, ensuring pixel-perfect design implementation, and collaborated with designers to define shared style variables to reduce communication overhead.
- Self-learned Angular framework and delivered a functional Todo List application within one week, demonstrating strong ability to quickly adopt new technologies and apply them in real projects.
- Refactored redundant functionalities into reusable components, improving code readability and reducing long-term maintenance costs.

## Technical Skills

- Languages: JavaScript (ES6+), TypeScript, Node.js, HTML/CSS, Python.
- Technologies: Vue, Nuxt.js, React, Next.js, Tailwind/Uno CSS, jest, yarn, Git.
- AI-Assisted Development: Cursor, Claude 3.5/4, Gemini, ChatGPT

## Certifications

- Japanese: JLPT N2 (Business Level)
